

trim()

Trims leading and trailing whitespace, such as spaces and tabs, from String table values. If no column is specified, then the values in all columns and rows are trimmed. A specific column may be referenced by either its ID or title.

Examples

```
function setup() {  
  let table = new p5.Table();  
  
  table.addColumn('name');  
  table.addColumn('type');  
  
  let newRow = table.addRow();  
  newRow.setString('name', '  Lion  ');  
  newRow.setString('type', ' Mammal ');  
  
  newRow = table.addRow();  
  newRow.setString('name', ' Snake ');  
  newRow.setString('type', ' Reptile ');  
  
  table.trim();  
  print(table.getArray());  
}  
  
// prints:  
// 0  "Lion"    "Mamal"  
// 1  "Snake"   "Reptile"
```

Syntax

```
trim([column])
```

Parameters

column

String|Integer: Column ID (number) or name (string)
