

removeAttribute()

Removes an attribute from the element.

The parameter `attr` is the attribute's name as a string. For example, calling `myElement.removeAttribute('align')` removes its `align` attribute if it's been set.

Examples

```
hi ▶ ■
let p;

function setup() {
  createCanvas(100, 100);

  background(200);

  // Create a paragraph element and place it in the center of
  // the canvas.
  // Set its "align" attribute to "center".
  p = createP('hi');
  p.position(0, 20);
  p.attribute('align', 'center');

  describe('The text "hi" written in black at the center of a
gray square. The text moves to the left edge when double-
clicked.');
}

// Remove the 'align' attribute when the user double-clicks
// the paragraph.
function doubleClicked() {
  p.removeAttribute('align');
}
```

Syntax

```
removeAttribute(attr)
```

Parameters

`attr` String: attribute to remove.
