

setString()

Stores a String value in the TableRow's specified column. The column may be specified by either its ID or title.

Examples

```
// Given the CSV file "mammals.csv" in the project's "assets" folder:
//
// id,species,name
// 0,Capra hircus,Goat
// 1,Panthera pardus,Leopard
// 2,Equus zebra,Zebra

let table;

function preload() {
  //my table is comma separated value "csv"
  //and has a header specifying the columns labels
  table = loadTable('/assets/mammals.csv', 'csv', 'header');
}

function setup() {
  let rows = table.getRows();
  for (let r = 0; r < rows.length; r++) {
    let name = rows[r].getString('name');
    rows[r].setString('name', 'A ' + name + ' named George');
  }

  print(table.getArray());
}

describe('no image displayed');
}
```

Syntax

```
setString(column, value)
```

Parameters

column	String Integer: Column ID (Number) or Title (String)
value	String Number Boolean Object: The value to be stored as a String
