

# copyToContext()

Copies the shader from one drawing context to another.

Each `p5.Shader` object must be compiled by calling `shader()` before it can run. Compilation happens in a drawing context which is usually the main canvas or an instance of `p5.Graphics`. A shader can only be used in the context where it was compiled. The `copyToContext()` method compiles the shader again and copies it to another drawing context where it can be reused.

The parameter, `context`, is the drawing context where the shader will be used. The shader can be copied to an instance of `p5.Graphics`, as in `myShader.copyToContext(pg)`. The shader can also be copied from a `p5.Graphics` object to the main canvas using the `window` variable, as in `myShader.copyToContext(window)`.

Note: A `p5.Shader` object created with `createShader()`, `createFilterShader()`, or `loadShader()` can be used directly with a `p5.Framebuffer` object created with `createFramebuffer()`. Both objects have the same context as the main canvas.

## Examples

```
// Note: A "uniform" is a global variable within a shader
```

```
program.
```

```
// Create a string with the vertex shader program.
```

```
// The vertex shader is called for each vertex.
```

```
let vertSrc = `
```

```
precision highp float;
```

```
uniform mat4 uModelViewMatrix;
```

```
uniform mat4 uProjectionMatrix;
```

```
attribute vec3 aPosition;
```

```
attribute vec2 aTexCoord;
```

```
varying vec2 vTexCoord;
```

```
void main() {
```

```
    vTexCoord = aTexCoord;
```

```
    vec4 positionVec4 = vec4(aPosition, 1.0);
```

```
    gl_Position = uProjectionMatrix * uModelViewMatrix *
```

```
positionVec4;
```

```
}
```

```
`;
```

```
// Create a string with the fragment shader program.
```

```
// The fragment shader is called for each pixel.
```

```
let fragSrc = `
```

```
precision mediump float;
```

```
// Note: A "uniform" is a global variable within a shader
```

```
program.
```

```
// Create a string with the vertex shader program.
```

```
// The vertex shader is called for each vertex.
```

```
let vertSrc = `
```

```
precision highp float;
```

```
uniform mat4 uModelViewMatrix;
```

```
uniform mat4 uProjectionMatrix;
```

```
attribute vec3 aPosition;
```

```
attribute vec2 aTexCoord;
```

```
varying vec2 vTexCoord;
```

```
void main() {
```

```
    vTexCoord = aTexCoord;
```

```
    vec4 positionVec4 = vec4(aPosition, 1.0);
```

```
    gl_Position = uProjectionMatrix * uModelViewMatrix *
```

```
positionVec4;
```

```
}
```

```
`;
```

```
// Create a string with the fragment shader program.
```

```
// The fragment shader is called for each pixel.
```

```
let fragSrc = `
```

```
precision mediump float;
```

## Syntax

```
copyToContext(context)
```

## Parameters

`context` p5|p5.Graphics: WebGL context for the copied shader.

## Returns

p5.Shader: new shader compiled for the target context.
