getURLPath()

Returns the current URL path as an `Array` of `String`s.

For example, consider a sketch hosted at the URL `https://example.com/sketchbook`. Calling `getURLPath()` returns `['sketchbook']`. For a sketch hosted at the URL `https://example.com/sketchbook/monday`, `getURLPath()` returns `['sketchbook', 'monday']`.

Examples

srcdoc

```
function setup() {
  background(200);

  // Get the sketch's URL path
  // and display the first
  // part.
  let path = getURLPath();
  text(path[0], 25, 54);

  describe('The word "reference" written in
black on a gray background.');
}
```

Returns

String[]: path components.
