Reference > removeColumn()

removeColumn()

Use removeColumn() to remove an existing column from a Table object. The column to be removed may be identified by either its title (a String) or its index value (an int). removeColumn(0) would remove the first column, removeColumn(1) would remove the second column, and so on.

Examples

```
// Given the CSV file "mammals.csv"
 // in the project's "assets" folder:
 //
 // id,species,name
 // 0,Capra hircus,Goat
 // 1,Panthera pardus,Leopard
 // 2,Equus zebra,Zebra

 let table;

 function preload() {
 //my table is comma separated value "csv"
 //and has a header specifying the columns labels
 table = loadTable('/assets/mammals.csv', 'csv', 'header');
 }

 function setup() {
 table.removeColumn('id');
 print(table.getColumnCount());
 describe('no image displayed');
 }
```

Syntax

```
removeColumn(column)
```

Parameters

column   String|Integer: columnName (string) or ID (number)
